

The signals to help WCO sellers win deals and hold owned-brand margin.

A read-only, vendor-side intelligence and activity platform inside WCO. It surfaces the signals and tracks our engagement, so the Owned Brands team engages the right opportunity at the right time.

surface signal → reach the right seller → win & hold margin → growth

We lack the signals that win deals and protect margin

We are the vendor team

WCO is our primary customer. The Owned Brands team calls on WCO sellers and select customers to help them win with owned brands.

We have no early warning

We cannot see which sellers are about to lose a winnable deal, or where competitive pressure is eroding owned-brand margin.

We have no purpose-built tools

WCO's ERP and CRM were not built for the vendor lens. Tools designed for it would lift win rate and margin organization-wide.

The platform's role: surface those signals and position the Owned Brands team where it can change the outcome.

A deal we would lose today, and how the platform wins it

The deal

A WCO seller is bidding a security project: a national-brand camera line, with the rest of the bill of materials still open. The seller sourced it and holds registered project pricing on the cameras.

The threat

A competing distributor bids the same cameras, but pairs them with its own-brand cable. The extra margin on that cable lets it beat our total price, registered pricing and all.

How we win

The platform flags this seller. The OB team helps specify Owned Brands into the bill of materials, lifting margin and sharpening total price, so WCO keeps the deal.

Today no system surfaces this seller in time. Closing that gap is the platform's core purpose.

One loop moves a signal to a closed, higher-margin deal

The SKU is the spine. One detail view unifies sales, stock, opportunities, crosses, and activity. Two tiers run the model: the WCO seller channel (push) and WCO customers (pull).

A vendor-side platform and CRM, already prototyped

Cross database

Competitive product to owned-brand mapping. OB enablement, not org-wide access.

Signals + supply

Where to engage: deals at risk, margin under pressure, and the supporting stock signal.

Vendor-lens CRM

OB-generated opportunities; engagement with WCO sellers, our customer (not in the CRM).

AI email-drop

A note becomes structured records; opportunity-loss and product signals.

Leadership dashboard

Natural-language query over the whole pipeline.

Inventory & forecast

Stock overlay with pipeline-weighted demand.

Built read-only and in-tenant. Margin/cost confined to the authorized OB group.

Already prototyped: the leadership view

1

Conversion value loop

Identified → crossed → in progress → converted, tracked live.

2

Pipeline by owned brand

LCO AV, LCO Cable and more, ranked by open opportunity.

3

Engagement by party

Calls, visits, demos logged for the WCO seller and customer.

Working two-persona wireframe (Leadership + Sales Team); sample data only. This is proven UX, not a concept.

The team is built to execute. The tool is the missing piece.

We have integrated the LCO sales organization, adding capability and aligning structure to the Owned Brands mandate inside WCO. The structure is in place; the missing piece is the toolset that gives it the visibility it does not have today.

Equipping the team now compounds that structural investment. Without it, winnable deals like the one above continue to slip away unseen.

FIRST 90 DAYS

30

opportunities WCO would otherwise
have lost, identified and supported.

Governed end to end: read-only data in, the win out

Entra ID SSO · RBAC + row-level security · stays inside the Microsoft / Azure boundary, no egress

Not doing: no writes to the ERP or CRM, no direct DB connectivity, no duplication, no access outside OB, no egress.

Proposed and aligned to confirmed WCO Azure standards; the exact governed-data mechanism is confirmed with the Data Office before build.

A phased build I can execute solo

Phased by design: each phase is independently valuable and lowers the risk of the next.

THE ASK

Approve read-only access, an Azure environment, and governance liaisons

1

Read-only data access

Governed WCO sales data incl. margin/cost, via certified datasets, Power BI, or the API layer.
User group: the Owned Brands sales team only. No access provided outside of OB.

2

Azure build environment

Subscription / resource group under WCO governance, Entra ID app registration, Azure OpenAI in-tenant, and a Power BI workspace with certified-dataset read access.

3

Governance liaisons

Named contacts from Data Office, BI Governance, Cloud Engineering, and IT Security, plus confirmation of the access-request workflow and margin/cost classification.

Not requested: writes to the ERP or CRM, direct DB connectivity, data duplication, access outside OB, or any egress.

Approve these, and the Owned Brands team can see the signals and act on them.
